

THE BENEFITS OF USING ENVIRO-SOLUTIONS' PRODUCTS FOR FLOOR CARE MAINTENANCE

Our cleaners offer specific benefits in the care and the maintenance of institutional and consumer floor coverings.

- ❑ Floors, especially ones not maintained with modern acrylic floor polishes, have presented maintenance staff and building managers with unique challenges.
- ❑ The routine in most floor cleaning operations is to dilute a cleaner and wash the floor with a mop and a bucket or automated equipment. Floors usually do not get rinsed with clear water; therefore, detergent residues remain on the cleaned surfaces. On floors such as ceramic tiles, the grout lines tend to become discoloured as accumulated soil and diluted cleaning solutions accumulated, eventually become visually discoloured.
- ❑ Refinished vinyl floors can become dull and unattractive. Much of the persistent problems are associated with accumulated soils and detergent residues.
- ❑ Many manufacturers have developed specialty floor cleaners sometimes referred to as neutral cleaners, relating to the specific pH of the cleaner. The thinking is if you remove the builders such as phosphates, NTA or soda ash, etc., you decrease the amount of surface dulling. Formulations usually replace builders with chelating agents such as EDTA to improve hard water tolerance and to remove salt and calcium deposits in winter months.
- ❑ The benefits of using Enviro-Solutions' Floor Cleaners are that they do not use NTA or EDTA, thereby being more environmentally sound. Secondly, by removing builders, the traditionally cleaners give up muscle to remove soil. Our cleaners clean very well.
