

## **FLOOR FINISH APPLICATION**

1. If floor has been stripped, ensure floor has been neutralized and clear water rinsed properly prior to finish application procedures. If floor has been scrubbed, neutralizing is not necessary, however, a clear water rinse is required. Check pH of floor.
2. Assemble all equipment, chemicals and custodial hardware prior to beginning procedures. Read safety instruction on MSDSs and chemical product labels and comply as directed.
3. Place Wet Floor Signs at access area(s) to foot traffic.
4. Pour in a bucket with wringer lined with a plastic bag. Immerse clean, pre-broken in, lint free, dedicated floor finish mop fully in finish. Wring out bottom half of mop.
5. Apply your choice of an Enviro-Solution's Floor Finish. Apply 5 or 6 medium coats depending upon porosity of floor, desired appearance, traffic conditions, etc. If Sealer used, 4 or 5 medium coats should be adequate. Start each coat in a different area of the floor.

**NOTE:** Sealer is optional when using Enviro-Solutions' Floor Finishes unless floor is extremely porous, when preparing a new floor, or when traffic is extremely heavy. However, a sealer is highly recommended for all floor set-ups, as it will greatly enhance the floor finish and increases its durability.
