

IN-HOUSE SPOT AND STAIN REMOVAL

1. Before treating any spot or stain, if any accumulation of residual is visible, as appropriate, vacuum or scrape as much of the residual from the surface as possible with a whale bone scraper or a wooden paint stir stick. Do not use any type of scraping tool that may cut or break the carpet fibers.
2. To determine if a spot or stain will come out using the ES88 solution, apply solution to the stain, allow 3 to 5 minutes contact time and then blot it firmly with a dry, white absorbent cloth. If any residual transfers to the cloth, the spot will come out with this dilution. If it does not transfer to the cloth, pre-test the stain with a stronger dilution of ES88.
3. Apply the appropriate solution to the affected area, 3 to 6 inches larger than the surface size of the spot or stain. Liquids usually fan out under the surface of the spot or stain and may re-appear on the carpet surface outside of the treated area. Tamp in solution with a tamping brush. Do not scrub or brush the spot or stain. Allow 5 minutes contact time. Apply solution to several spots or stains, while allowing contact time.
4. Blot and wipe the spot or stain with a clean, dry, white absorbent cloth, towards the center of the treated area until all of the affected area is clean.
5. Re-spray the treated areas with clear water, to rinse out any residual and blot as much of the moisture from the treated areas as possible. Leave a weighted, white cloth over the spot for a period of time to blot out any remaining moisture.
6. Wash all white spotting cloths with ES88 in a suitable washing machine and dry for next use.
