

Hi Mike,

I took these before and after pictures at a health club. As you can see the shower walls have a pretty good build up of soap scum and calcium deposits. I applied ES 56 through a foam sprayer. Let it set for about 2 minutes, scrubbed with a brush, and rinsed. As you can see ES 56 worked very well. The customer had been using an acid based product and wanted to get away from it. They had not been able to find anything that worked as well as the acid product. Needless to say they were very happy with ES 56. They will use ES 56 for the initial cleaning and then use ES 56C to maintain.
